

# Strong maximal function revisit on Heisenberg group

Chuhan Sun

## Abstract

We prove the  $L^p$ -boundedness of the strong maximal operator defined on a Heisenberg group *w.r.t* an absolutely continuous measure satisfying the product  $\mathbf{A}_\infty$ -property.

## 1 Introduction

The study of certain operators that commute with a multi-parameter family of dilations, dates back to the time of Jessen, Marcinkiewicz and Zygmund. A number of pioneering results have been accomplished, for example by Córdoba and Fefferman [1], Fefferman and Stein [7], Fefferman [5], Müller, Ricci and Stein [10], Journé [11] and Pipher [12].

In this paper, we consider the strong maximal function operator defined on a Heisenberg group with a multiplication law:

$$(u, v, t) \odot (\xi, \eta, \tau) = \left[ u + \xi, v + \eta, t + \tau + \mu(u \cdot \eta - v \cdot \xi) \right], \quad \mu \in \mathbb{R} \quad (1.1)$$

for every  $(u, v, t) \in \mathbb{R}^n \times \mathbb{R}^n \times \mathbb{R}$  and  $(\xi, \eta, \tau)^{-1} = (-\xi, -\eta, -\tau) \in \mathbb{R}^n \times \mathbb{R}^n \times \mathbb{R}$ .

Denote  $\mathbf{R}$  to be a rectangle in  $\mathbb{R}^{2n+1}$  parallel to the coordinates. Moreover,

$$\mathbf{R} = \bigotimes_{i=1}^m \mathbf{Q}_i \times I \subset \bigotimes_{i=1}^m \mathbb{R}^{\mathbf{N}_i} \times \mathbb{R}, \quad \mathbf{N}_1 + \mathbf{N}_2 + \cdots + \mathbf{N}_m = 2n \quad (1.2)$$

where  $\mathbf{Q}_i \subset \mathbb{R}^{\mathbf{N}_i}, i = 1, 2, \dots, m$  are cubes and  $I \subset \mathbb{R}$  is an interval.

A strong maximal operator  $\mathbf{M}$  is initially defined on a Heisenberg group as

$$\mathbf{M}f(u, v, t) = \sup_{\mathbf{R} \ni (0,0,0)} \text{vol}\{\mathbf{R}\}^{-1} \iiint_{\mathbf{R}} |f[(u, v, t) \odot (\xi, \eta, \tau)^{-1}]| d\xi d\eta d\tau. \quad (1.3)$$

Let  $\xi \longrightarrow u - \xi, \eta \longrightarrow v - \eta$  and  $\tau \longrightarrow t - \tau$ ,  $\mathbf{M}$  can be equivalently defined as

$$\mathbf{M}f(u, v, t) = \sup_{\mathbf{R} \ni (u,v,t)} \text{vol}\{\mathbf{R}\}^{-1} \iiint_{\mathbf{R}} |f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi))| d\xi d\eta d\tau. \quad (1.4)$$

◇ Throughout,  $\mathfrak{B} > 0$  is regarded as a generic constant depending on its sub-indices.

**Theorem A: Christ, 1992** *Let  $\mathbf{M}$  be defined in (1.3). We have*

$$\|\mathbf{M}f\|_{L^q(\mathbb{R}^{2n+1})} \leq \mathfrak{B}_p \|f\|_{L^p(\mathbb{R}^{2n+1})}, \quad 1 < p < \infty. \quad (1.5)$$

The  $L^p$ -boundedness of  $\mathbf{M}$  defined on more general Nilpotent Lie groups can be found in the

paper of Michael Christ [4], in which the elegant argument is carried out using a number of ‘ingredients’ developed previously by Ricci and Stein [9] and Christ [2]-[3].

Our aim is to give a generalization of **Theorem A** by defining  $\mathbf{M}$  w.r.t some appropriate absolutely continuous measure:  $\omega(u, v)dudvdt$ . Given any subset  $E \subset \mathbb{R}^{2n+1}$ , we write

$$\mathbf{vol}_\omega\{E\} = \iiint_E \omega(u, v)dudvdt.$$

Define

$$\mathbf{M}_\omega f(u, v, t) = \sup_{\mathbf{R} \ni (u, v, t)} \mathbf{vol}_\omega\{\mathbf{R}\}^{-1} \iiint_{\mathbf{R}} |f(\xi, \eta, \tau + \mu(u \cdot \xi - v \cdot \eta))| \omega(\xi, \eta) d\xi d\eta d\tau. \quad (1.6)$$

Let  $(x_i, x_i^\dagger) \in \mathbb{R}^{N_i} \times \mathbb{R}^{2n-N_i}$  for every  $i = 1, 2, \dots, m$  where  $N_1 + N_2 + \dots + N_m = 2n$ . We say

$$\omega \in \bigotimes_{i=1}^m \mathbf{A}_\infty(\mathbb{R}^{2n}), \quad (1.7)$$

if  $\omega(\cdot, x_i^\dagger)$  satisfies the  $\mathbf{A}_\infty$ -property in  $\mathbb{R}^{N_i}$  for every  $x_i^\dagger \in \mathbb{R}^{2n-N_i}$ .

◊ For brevity, we abbreviate  $\|f\|_{L^p(\mathbb{R}^{2n+1}, \omega)}^p = \iiint_{\mathbb{R}^{2n+1}} |f(u, v, t)|^p \omega(u, v) dudvdt, 1 < p < \infty$ .

**Theorem A\*** Let  $\mathbf{M}_\omega$  be defined in (1.6). Suppose  $\omega \in \bigotimes_{i=1}^m \mathbf{A}_\infty(\mathbb{R}^{2n})$ . We have

$$\|\mathbf{M}_\omega f\|_{L^p(\mathbb{R}^{2n+1}, \omega)} \leq \mathfrak{B}_p \omega \|f\|_{L^p(\mathbb{R}^{2n+1}, \omega)}, \quad 1 < p < \infty. \quad (1.8)$$

The proof of **Theorem A\*** is an application of a multi-parameter covering lemma due to Córdoba and Fefferman [1]: Unlike the Vitali-type covering lemma for cubes, there is no mutually disjointness between rectangles. Instead, this is replaced by the  $L^p$ -norm of a summation of indicator functions supported on a sequence of selected rectangles. We observe that Córdoba-Fefferman covering lemma is particularly useful to handle  $\mathbf{M}_\omega$  defined on a Heisenberg group.

We prove **Theorem A\*** in Section 2. For the sake of self-containedness, we give a proof of the covering lemma within the required setting in Section 3.

## 2 Proof of Theorem A\*

Consider  $(u, v, t) = (x_i, x_i^\dagger) \in \mathbb{R}^{N_i} \times \mathbb{R}^{2n+1-N_i}$  for every  $i = 1, 2, \dots, k$ . We define

$$\mathbf{w} \in \bigotimes_{i=1}^k \mathbf{A}_\infty(\mathbb{R}^{2n+1}), \quad (2.1)$$

where  $\mathbf{w}(\cdot, x_i^\dagger)$  satisfies the  $\mathbf{A}_\infty$ -property in  $\mathbb{R}^{N_i}$  for every  $x_i^\dagger \in \mathbb{R}^{2n+1-N_i}, i = 1, 2, \dots, k$ .

For every subset  $E \subset \mathbb{R}^{2n+1}$ , we write

$$\mathbf{vol}_{\mathbf{w}}(E) = \iiint_E \mathbf{w}(u, v, t) du dv dt. \quad (2.2)$$

Especially, if  $\mathbf{w} = 1$ , then the measure becomes the Lebesgue measure, and

$$\mathbf{vol}(E) = \mathbf{vol}_1(E) = \iiint_E 1 du dv dt. \quad (2.3)$$

Abbreviate

$$\|f\|_{L^p(\mathbb{R}^{2n+1}, \mathbf{w})}^p = \iiint_{\mathbb{R}^{2n+1}} |f(u, v, t)|^p \mathbf{w}(u, v, t) du dv dt, \quad 1 < p < \infty.$$

**Córdoba-Fefferman covering lemma** *Let  $\{\mathbf{R}_j\}_{j=1}^\infty$  be a collection of rectangles in  $\mathbb{R}^{2n+1}$  parallel to the coordinates. Suppose  $\mathbf{w} \in \bigotimes_{i=1}^k \mathbf{A}_\infty(\mathbb{R}^{2n+1})$ . There is a subsequence  $\{\widehat{\mathbf{R}}_k\}_{k=1}^\infty$  such that*

$$\mathbf{vol}_{\mathbf{w}}\left\{\bigcup_j \mathbf{R}_j\right\} \lesssim \mathbf{vol}_{\mathbf{w}}\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\} \quad (2.4)$$

and

$$\left\|\sum_k \chi_{\widehat{\mathbf{R}}_k}\right\|_{L^p(\mathbb{R}^{2n+1}, \mathbf{w})}^p \lesssim \mathbf{vol}_{\mathbf{w}}\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\}, \quad 1 < p < \infty \quad (2.5)$$

where  $\chi$  is an indicator function.

We take  $\mathbf{w}(u, v, t) = \omega(u, v) \cdot 1$ , where  $\omega \in \bigotimes_{i=1}^m \mathbf{A}_\infty(\mathbb{R}^{2n})$ . Then (2.4)-(2.5) become

$$\mathbf{vol}_{\omega}\left\{\bigcup_j \mathbf{R}_j\right\} \lesssim \mathbf{vol}_{\omega}\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\} \quad (2.6)$$

and

$$\left\|\sum_k \chi_{\widehat{\mathbf{R}}_k}\right\|_{L^p(\mathbb{R}^{2n+1}, \omega)}^p \lesssim \mathbf{vol}_{\omega}\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\}, \quad 1 < p < \infty. \quad (2.7)$$

Let

$$\mathbf{U}_\lambda = \left\{(x, y, t) \in \mathbb{R}^n \times \mathbb{R}^n \times \mathbb{R} : \mathbf{M}_\omega f(u, v, t) > \lambda\right\}. \quad (2.8)$$

Given any  $(u, v, t) \in \mathbf{U}_\lambda$ , there is a rectangle  $\mathbf{R}_j \ni (u, v, t)$  such that

$$\mathbf{vol}_{\omega}\{\mathbf{R}_j\}^{-1} \iiint_{\mathbf{R}_j} |f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi))| \omega(\xi, \eta) d\xi d\eta d\tau > \frac{1}{2} \lambda. \quad (2.9)$$

Let  $(u, v, t)$  run through the set  $\mathbf{U}_\lambda$ . We have

$$\mathbf{U}_\lambda \subset \bigcup_j \mathbf{R}_j.$$

By applying the covering lemma, we select a subsequence  $\{\widehat{\mathbf{R}}_k\}_{k=1}^\infty$  from the union above and

$$\begin{aligned}
\mathbf{vol}_\omega\left\{\mathbf{U}_\lambda\right\} &\lesssim \mathbf{vol}_\omega\left\{\bigcup_j \mathbf{R}_j\right\} \lesssim \mathbf{vol}_\omega\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\} \quad \text{by (2. 6)} \\
&\leq \sum_k \mathbf{vol}_\omega\left\{\widehat{\mathbf{R}}_k\right\} \\
&\leq \sum_k \frac{2}{\lambda} \iiint_{\widehat{\mathbf{R}}_k} |f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi))| \omega(\xi, \eta) d\xi d\eta d\tau \quad \text{by (2. 9).}
\end{aligned} \tag{2. 10}$$

Furthermore, we find

$$\begin{aligned}
\mathbf{vol}_\omega\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\} &\lesssim \lambda^{-1} \sum_k \iiint_{\widehat{\mathbf{R}}_k} |f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi))| \omega(\xi, \eta) d\xi d\eta d\tau \\
&= \lambda^{-1} \iiint_{\mathbb{R}^{2n+1}} \left| f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi)) \sum_k \chi_{\widehat{\mathbf{R}}_k}(\xi, \eta, \tau) \right| \omega(\xi, \eta) d\xi d\eta d\tau \\
&\leq \lambda^{-1} \left\{ \iiint_{\mathbb{R}^{2n+1}} |f(\xi, \eta, \tau + \mu(u \cdot \eta - v \cdot \xi))|^p \omega(\xi, \eta) d\xi d\eta d\tau \right\}^{\frac{1}{p}} \left\| \sum_k \chi_{\widehat{\mathbf{R}}_k} \right\|_{\mathbf{L}^{\frac{p}{p-1}}(\mathbb{R}^{2n+1}, \omega)} \\
&\quad \text{by Hölder inequality} \\
&= \lambda^{-1} \left\{ \iint_{\mathbb{R}^{2n}} \|f(\xi, \eta, \cdot)\|_{\mathbf{L}^p(\mathbb{R})}^p \omega(\xi, \eta) d\xi d\eta \right\}^{\frac{1}{p}} \left\| \sum_k \chi_{\widehat{\mathbf{R}}_k} \right\|_{\mathbf{L}^{\frac{p}{p-1}}(\mathbb{R}^{2n+1}, \omega)} \\
&\leq \lambda^{-1} \|f\|_{\mathbf{L}^p(\mathbb{R}^{2n+1}, \omega)} \mathbf{vol}_\omega\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\}^{\frac{p-1}{p}} \quad \text{by (2. 7).}
\end{aligned} \tag{2. 11}$$

This implies

$$\mathbf{vol}_\omega\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\}^{\frac{1}{p}} \lesssim \frac{1}{\lambda} \|f\|_{\mathbf{L}^p(\mathbb{R}^{2n+1}, \omega)}. \tag{2. 12}$$

Let  $\mathbf{U}_\lambda$  defined in (2. 8). We have

$$\begin{aligned}
\mathbf{vol}_\omega\left\{(x, y, t) \in \mathbb{R}^n \times \mathbb{R}^n \times \mathbb{R} : \mathbf{M}_\omega f(u, v, t) > \lambda\right\}^{\frac{1}{p}} &= \mathbf{vol}_\omega\left\{\mathbf{U}_\lambda\right\}^{\frac{1}{p}} \\
&\lesssim \mathbf{vol}_\omega\left\{\bigcup_k \widehat{\mathbf{R}}_k\right\}^{\frac{1}{p}} \quad \text{by (2. 10)} \\
&\lesssim \frac{1}{\lambda} \|f\|_{\mathbf{L}^p(\mathbb{R}^{2n+1}, \omega)} \quad \text{by (2. 12).}
\end{aligned} \tag{2. 13}$$

By using this weak type  $(p, p)$ -estimate and applying Marcinkiewicz interpolation theorem, we conclude that  $\mathbf{M}_\omega$  is bounded on  $\mathbf{L}^p(\mathbb{R}^{2n+1}, \omega)$  for  $1 < p < \infty$ .

### 3 Proof of the covering lemma

First, we need the following lemma proved by Fefferman [6]:

**Lemma 3.1.** *If  $\mathbf{w} \in \bigotimes_{i=1}^k \mathbf{A}_\infty(\mathbb{R}^{2n+1})$ , then  $\mathbf{w}$  satisfies the following: If  $\mathbf{R} \subset \mathbb{R}^{2n+1}$  is any rectangle with its sides parallel to the axes and  $E \subset \mathbf{R}$  is such that  $\text{vol}(E) > \frac{1}{2}\text{vol}(\mathbf{R})$ , then  $\text{vol}_{\mathbf{w}}(E) > \eta \text{vol}_{\mathbf{w}}(\mathbf{R})$ , for some  $\eta > 0$ .*

**Proof.** The proof is by induction on  $k$ . Assume the result is true for  $k-1$ . Consider a rectangle  $\mathbf{R}$  as above,  $\mathbf{R} = I \times J$  where  $I$  is a rectangle in  $\mathbb{R}^{\mathbf{N}_1} \times \mathbb{R}^{\mathbf{N}_2} \times \dots \times \mathbb{R}^{\mathbf{N}_{k-1}}$ , and  $J$  is a cube in  $\mathbb{R}^{\mathbf{N}_k}$ ,  $\mathbf{N}_1 + \mathbf{N}_2 + \dots + \mathbf{N}_k = 2n + 1$ .

Let  $E \subset \mathbf{R}$  such that

$$\frac{\text{vol}(E)}{\text{vol}(\mathbf{R})} > \frac{1}{2}. \quad (3.1)$$

For each  $x_k^\dagger \in I$ , let  $J_{x_k^\dagger} = \{(x_k^\dagger, x_k) : x_k \in J\}$ . We claim that there exists  $I' \subset I$  satisfying  $\text{vol}(I') \geq \varepsilon \text{vol}(I)$ , where  $\varepsilon > 0$  is small enough, such that for  $x_k^\dagger \in I'$ ,

$$\text{vol}(E \cap J_{x_k^\dagger}) > \varepsilon \text{vol}(J_{x_k^\dagger}) = \varepsilon \text{vol}(J). \quad (3.2)$$

If not, we must have  $\text{vol}\left(\left\{x_k^\dagger \in I : \text{vol}(E \cap J_{x_k^\dagger}) > \varepsilon \text{vol}(J)\right\}\right) \leq \varepsilon \text{vol}(I)$ .

Divide  $I$  into two parts:

$$G = \left\{x_k^\dagger \in I : \text{vol}(E \cap J_{x_k^\dagger}) > \varepsilon \text{vol}(J)\right\}, \quad B = \left\{x_k^\dagger \in I : \text{vol}(E \cap J_{x_k^\dagger}) \leq \varepsilon \text{vol}(J)\right\}. \quad (3.3)$$

Then

$$\begin{aligned} \text{vol}(E) &= \int_B \text{vol}(E \cap J_{x_k^\dagger}) dx_k^\dagger + \int_G \text{vol}(E \cap J_{x_k^\dagger}) dx_k^\dagger \\ &\leq \text{vol}(B) \cdot \varepsilon \text{vol}(J) + \text{vol}(G) \cdot \text{vol}(J) \\ &= [\text{vol}(I) - \text{vol}(G)] \cdot \varepsilon \text{vol}(J) + \text{vol}(G) \cdot \text{vol}(J) \\ &= \varepsilon \text{vol}(I) \cdot \text{vol}(J) + (1 - \varepsilon) \text{vol}(G) \cdot \text{vol}(J) \end{aligned} \quad (3.4)$$

Suppose  $\text{vol}(G) \leq \varepsilon \text{vol}(I)$ , then we further have

$$\text{vol}(E) \leq \varepsilon \text{vol}(I) \cdot \text{vol}(J) + (1 - \varepsilon) \cdot \varepsilon \text{vol}(I) \cdot \text{vol}(J) \leq (2\varepsilon - \varepsilon^2) \text{vol}(\mathbf{R}). \quad (3.5)$$

We can choose  $\varepsilon > 0$  small enough such that  $0 < 2\varepsilon - \varepsilon^2 < \frac{1}{2}$ , then

$$\text{vol}(E) < \frac{1}{2} \text{vol}(\mathbf{R}), \quad (3.6)$$

which is contradicted to  $\frac{\text{vol}(E)}{\text{vol}(\mathbf{R})} > \frac{1}{2}$ .

Now, from (3. 2) and since  $\mathbf{w}(x_k^\dagger, \cdot)$  is  $\mathbf{A}^\infty$  in the  $x_k$  variable for every  $x_k^\dagger \in \mathbb{R}^{2n+1-N_k}$ , we have

$$\int_{E \cap J_{x_k^\dagger}} \mathbf{w}(x_k^\dagger, x_k) dx_k \geq \eta \int_{J_{x_k^\dagger}} \mathbf{w}(x_k^\dagger, x_k) dx_k, \quad x_k^\dagger \in I'. \quad (3. 7)$$

But also if we fix any  $x_k \in J$ , then

$$\int_{I'} \mathbf{w}(x_k^\dagger, x_k) dx_k^\dagger \geq \eta' \int_I \mathbf{w}(x_k^\dagger, x_k) dx_k^\dagger, \quad (3. 8)$$

by induction. It follows by integrating (3. 7) in  $x_k^\dagger \in I'$  that

$$\int_E \mathbf{w}(x) dx \geq \eta \int_{I' \times J} \mathbf{w}(x) dx, \quad (3. 9)$$

and integrating (3. 8) in  $x_k \in J$  gives

$$\int_{I' \times J} \mathbf{w}(x) dx \geq \eta' \int_{I \times J} \mathbf{w}(x) dx = \int_R \mathbf{w}(x) dx. \quad (3. 10)$$

By combining (3. 9)-(3. 10), we have

$$\int_E \mathbf{w}(x) dx \geq \eta \eta' \int_R \mathbf{w}(x) dx. \quad (3. 11)$$

Now we finish the proof of Lemma 3.1.

Then we continue to prove the covering lemma. We re-arrange the order of  $\{\mathbf{R}_j\}_{j=1}^\infty$  if necessary so that the cross-section volume of  $\mathbf{R}_j$  in  $\mathbb{R}^{N_k}$  is decreasing as  $j \rightarrow \infty$ . For brevity, we call it  $x_k$ -cross section. Denote  $\mathbf{R}_j^*$  to be the rectangle co-centered with  $\mathbf{R}_j$  having its  $x_k$ -cross section tripled and keeping the others same. We select  $\widehat{\mathbf{R}}_k$  from  $\{\mathbf{R}_j\}_{j=1}^\infty$  as follows.

Let  $\widehat{\mathbf{R}}_1 = \mathbf{R}_1$ . Having chosen  $\widehat{\mathbf{R}}_1, \widehat{\mathbf{R}}_2, \dots, \widehat{\mathbf{R}}_{N-1}$ , we pick  $\widehat{\mathbf{R}}_N$  as the first rectangle  $\mathbf{R}$  on the list of  $\mathbf{R}_j$ 's after  $\widehat{\mathbf{R}}_{N-1}$  so that

$$\text{vol} \left\{ \mathbf{R} \cap \left[ \bigcup_{\substack{k=1 \\ \widehat{\mathbf{R}}_k^* \cap \mathbf{R} \neq \emptyset}}^{N-1} \widehat{\mathbf{R}}_k^* \right] \right\} < \frac{1}{2} \text{vol} \{ \mathbf{R} \}. \quad (3. 12)$$

Suppose  $\mathbf{R}$  is an unselected rectangle. There is a positive number  $M$  such that  $\mathbf{R}$  is on the list of  $\mathbf{R}_j$ 's after  $\widehat{\mathbf{R}}_M$  and

$$\text{vol} \left\{ \mathbf{R} \cap \left[ \bigcup_{\substack{k=1 \\ \widehat{\mathbf{R}}_k^* \cap \mathbf{R} \neq \emptyset}}^M \widehat{\mathbf{R}}_k^* \right] \right\} \geq \frac{1}{2} \text{vol} \{ \mathbf{R} \}. \quad (3. 13)$$

Recall  $\widehat{\mathbf{R}}_k^*$  whose  $x_k$ -cross section is tripled. Moreover, the  $t$ -side length of  $\{\mathbf{R}_j\}_{j=1}^\infty$  is decreasing as  $j \rightarrow \infty$ . On the  $x_k$ -cross section, the projection of  $\mathbf{R}$  is covered by the projection of the union inside (3. 13).

Let  $(x_1, x_2, \dots, x_k) \in \mathbf{R}$ . Then slice all rectangles with a plane through  $(x_1, x_2, \dots, x_k)$  perpendicular to the  $x_k$ -cross section. Denote  $\mathbf{S}$ ,  $\widehat{\mathbf{S}}_k$  and  $\widehat{\mathbf{S}}_k^*$  to be the slices regarding to  $\mathbf{R}$ ,  $\widehat{\mathbf{R}}_k$  and  $\widehat{\mathbf{R}}_k^*$ . Consequently, (3. 13) implies

$$\text{vol} \left\{ \mathbf{S} \cap \left[ \bigcup_{k=1}^M \widehat{\mathbf{S}}_k^* \right] \right\} \geq \frac{1}{2} \text{vol} \{ \mathbf{S} \}. \quad (3. 14)$$

Since  $\mathbf{w} \in \bigotimes_{i=1}^{k-1} \mathbf{A}_\infty(\mathbb{R}^{2n+1})$ , then  $\mathbf{w}(\cdot, x_i^\dagger)$  satisfies the  $\mathbf{A}_\infty$ -property in  $\mathbb{R}^{N_i}$  for every  $x_i^\dagger \in \mathbb{R}^{2n+1-N_i}$ ,  $i = 1, 2, \dots, k$ . This implies  $\mathbf{w}(\cdot, x_k) \in \bigotimes_{i=1}^{k-1} \mathbf{A}_\infty(\mathbb{R}^{2n+1-N_k})$  for any fixed  $x_k \in \mathbb{R}^{N_k}$ .

For every subset  $F \subset \mathbb{R}^{2n+1-N_k}$ , we define

$$\text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k}(F) = \int_F \mathbf{w}(x_k^\dagger, x_k) dx_k^\dagger, \quad \text{for every } x_k \in \mathbb{R}^{N_k}. \quad (3. 15)$$

Then by Lemma 3.1, we have

$$\text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \left\{ \mathbf{S} \cap \left[ \bigcup_{k=1}^M \widehat{\mathbf{S}}_k^* \right] \right\} \geq \eta \text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \{ \mathbf{S} \}, \quad \eta > 0. \quad (3. 16)$$

Let  $\mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k}$  be the strong maximal operator defined in  $\mathbb{R}^{2n+1-N_k}$ . Observe that (3. 16) further implies

$$\mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k}(\chi_{\bigcup_k \widehat{\mathbf{S}}_k^*})(x_k^\dagger) > \eta, \quad x_k^\dagger \in \bigcup_j \mathbf{S}_j. \quad (3. 17)$$

It is well-known that  $\mathbf{M}_{\mathbf{w}(\cdot, x_1^\dagger)}^{N_1}$  is the Hardy-Littlewood maximal operator bounded on  $L^p(\mathbb{R}^{N_1}, \mathbf{w}(\cdot, x_1^\dagger))$ , for  $1 < p < \infty$ . By induction, we may assume that  $\mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k}$  is bounded on all  $L^p(\mathbb{R}^{2n+1-N_k}, \mathbf{w}(\cdot, x_k))$ ,  $1 < p < \infty$ . From (3. 16)-(3. 17), by applying the  $L^p$ -boundedness of  $\mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k}$ , we find

$$\text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \left\{ \bigcup_j \mathbf{S}_j \right\} \lesssim \text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \left\{ \bigcup_k \widehat{\mathbf{S}}_k^* \right\}. \quad (3. 18)$$

By using (3. 18) and integrating in the  $x_k$ -coordinate, we have

$$\text{vol}_{\mathbf{w}} \left\{ \bigcup_j \mathbf{R}_j \right\} \lesssim \text{vol}_{\mathbf{w}} \left\{ \bigcup_k \widehat{\mathbf{R}}_k^* \right\} \lesssim \text{vol}_{\mathbf{w}} \left\{ \bigcup_k \widehat{\mathbf{R}}_k \right\} \quad (3. 19)$$

which is (2. 4).

On the other hand, (3. 12) implies

$$\text{vol} \left\{ \widehat{\mathbf{S}}_N \cap \left[ \bigcup_{k=1}^{N-1} \widehat{\mathbf{S}}_k^* \right] \right\} < \frac{1}{2} \text{vol} \{ \widehat{\mathbf{S}}_N \}. \quad (3. 20)$$

We are given that the measure  $\mathbf{w}(\cdot, x_k)$  as above on the hyperplane ( if the hyperplane in  $x_k = \mathbf{c}$ , then  $d\mathbf{w}(\cdot, \mathbf{c}) = \mathbf{w}(x_1, x_2, \dots, x_{k-1}, \mathbf{c}) dx_1 dx_2 \dots dx_{k-1}$  ) belongs to  $\bigotimes_{i=1}^{k-1} \mathbf{A}_\infty(\mathbb{R}^{2n+1-N_k})$  for every  $x_k \in \mathbb{R}^{N_k}$ , so that for some  $\eta > 0$ ,

$$\text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \left\{ \widehat{\mathbf{S}}_N \cap \left[ \bigcup_{k=1}^{N-1} \widehat{\mathbf{S}}_k^* \right] \right\} < (1 - \eta) \text{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-N_k} \{ \widehat{\mathbf{S}}_N \}. \quad (3. 21)$$

Denote  $\widehat{\mathbf{E}}_N = \widehat{\mathbf{S}}_N \setminus \bigcup_{k < N} \widehat{\mathbf{S}}_k$ . From (3. 21), we find

$$\mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{E}}_N\} \geq \eta \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{S}}_N\}. \quad (3. 22)$$

Let  $\phi \in \mathbf{L}^{\frac{p}{p-1}}(\mathbb{R}^{2n+1-\mathbf{N}_k}, \mathbf{w}(\cdot, x_k))$  and  $\|\phi\|_{\mathbf{L}^{\frac{p}{p-1}}(\mathbb{R}^{2n+1-\mathbf{N}_k}, \mathbf{w}(\cdot, x_k))} = 1$ . We have

$$\begin{aligned} \int_{\mathbb{R}^{2n+1-\mathbf{N}_k}} \phi \cdot \sum_k \chi_{\widehat{\mathbf{S}}_k} d\mathbf{w}(\cdot, x_k) &= \sum_k \int_{\widehat{\mathbf{S}}_k} \phi d\mathbf{w}(\cdot, x_k) \\ &= \sum_k \left\{ \frac{1}{\mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{S}}_k\}} \int_{\widehat{\mathbf{S}}_k} \phi d\mathbf{w}(\cdot, x_k) \right\} \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{S}}_k\} \\ &\leq \sum_k \left\{ \frac{1}{\mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{S}}_k\}} \int_{\widehat{\mathbf{S}}_k} \phi d\mathbf{w}(\cdot, x_k) \right\} \cdot \frac{1}{\eta} \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \{\widehat{\mathbf{E}}_k\} \quad \text{by (3. 22)} \\ &\lesssim \sum_k \int_{\widehat{\mathbf{E}}_k} \mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k}(\phi) d\mathbf{w}(\cdot, x_k) \\ &= \int_{\bigcup_k \widehat{\mathbf{S}}_k} \mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k}(\phi) d\mathbf{w}(\cdot, x_k). \end{aligned} \quad (3. 23)$$

By applying Hölder inequality and the  $\mathbf{L}^p$ -boundedness of  $\mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k}$ , we find

$$\begin{aligned} \int_{\bigcup_k \widehat{\mathbf{S}}_k} \mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k}(\phi) d\mathbf{w}(\cdot, x_k) &\leq \left\| \mathbf{M}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k}(\phi) \right\|_{\mathbf{L}^{\frac{p}{p-1}}(\mathbb{R}^{2n+1-\mathbf{N}_k}, \mathbf{w}(\cdot, x_k))} \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \left\{ \bigcup_k \widehat{\mathbf{S}}_k \right\}^{\frac{1}{p}} \\ &\leq \mathfrak{B}_p \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \left\{ \bigcup_k \widehat{\mathbf{S}}_k \right\}^{\frac{1}{p}}. \end{aligned} \quad (3. 24)$$

By substituting (3. 24) to (3. 23) and taking the supremum of  $\phi$ , we arrive at

$$\left\| \sum_k \chi_{\widehat{\mathbf{S}}_k} \right\|_{\mathbf{L}^p(\mathbb{R}^{2n+1-\mathbf{N}_k}, \mathbf{w}(\cdot, x_k))} \leq \mathfrak{B}_p \mathbf{vol}_{\mathbf{w}(\cdot, x_k)}^{2n+1-\mathbf{N}_k} \left\{ \bigcup_k \widehat{\mathbf{S}}_k \right\}^{\frac{1}{p}}. \quad (3. 25)$$

Raising both sides of (3. 25) to the  $p^{th}$  power and integrating over  $x_k$  give us (2. 5).
